ZYGAL®
Connecting Structures

Team Operations Platform

A simple guide to logging in and using the system day to day

For every ZYGAL employee — Support, Team Lead, and Admin

1. Logging in
2. Understanding your role
3. The Dashboard
4. Sites
5. SIM Cards
6. Jobs — your daily work
7. Reports (Team Lead / Admin)
8. Logs (Team Lead / Admin)
9. Users (Admin only)
10. Common questions

1. Logging in

You do not need a password. You sign in with your office email and a one-time code that is emailed to you.

1. Open the platform link in your browser.
2. Type your office email address and press **Send code**.
3. Open your email inbox. A 6-digit code has arrived from ZYGAL.
4. Type that code into the box and press **Verify and sign in**. You are in.

Good to know: once you log in on a phone or computer, that device remembers you for 7 days. You will not need a code every time, unless you press Log out, or you don't use it for 7 days.

No code arriving? Check your Spam or Junk folder first. If it's still not there after a minute, press Resend code.

2. Understanding your role

What you can see and do depends on your role. This is automatic — you do not need to choose anything.

Role	What they can do
Support	Add and update Sites, SIM Cards, and Jobs. This is the main day-to-day role.
Team Lead	Everything Support can do, plus Reports and Logs (view-only history of what happened).
Admin	Everything above, plus adding/removing employees in Users.

3. The Dashboard

This is the first screen you see after logging in. It gives you a quick picture of everything happening right now.

- **Top cards** — how many active sites, jobs done this month, and how many are still pending.
- **By project** — a breakdown for each client project (like IDFC Bharat or Bajaj), showing how many of their sites are Live, Pending, or waiting on something.
- **Recent jobs** — the latest jobs entered, click any one to open it.

> **Tip:** click any number on the Dashboard to jump straight into the detailed list behind it.

4. Sites

A "Site" is one branch or location, like a bank branch or petrol pump, where ZYGAL has installed equipment.

To add a new site

1. Go to **Sites** in the left menu.
2. Press **Add site**.
3. Fill in the Project, Branch Code, State, and other details. Only pick from the dropdown lists — don't type your own spelling.
4. Press **Save site**.

To see everything about one site

Click on a site's Branch Code anywhere in the app. You'll see its SIM cards, and a full history of every job ever done there.

5. SIM Cards

Every site has hardware linked to it — SIM numbers, IP addresses, and door/vault device IDs. This tab shows all of them in one place.

1. Go to **SIM Cards** in the left menu to search or browse all of them.
2. To add one, open the site first (see Section 4), then press **Add SIM card** on that site's page.
3. Fill in the SIM number, IP, MAC ID, and the TAM device IDs as needed.

Note: each SIM card is always linked to one site, so you'll always know which branch a number belongs to.

6. Jobs — your daily work

A "Job" is one visit or task — an Installation, Activation, or Service Call. This is what Support fills in most often.

To log a new job

1. Go to **Jobs**, press **New job**.
2. Type the Branch Code. The system finds the site automatically — if it says "Not found," add the site first under Sites.
3. Fill in Call Type, who took the call, and the engineer if one is assigned.
4. Press **Create job**.

Updating a job

Click a Job number to open it. From there you can:

- Tick off checklist items (link plotted, NVR added, testing done, etc.)
- Log a material issue if something wasn't delivered or is faulty
- Change the Handover Status and Final Status

Important rule: you cannot mark a job as **Completed** or **Live** while Handover is still **Pending**, or while any material issue is still unresolved. The system will stop you and explain why. This is on purpose — it keeps the data honest.

7. Reports Team Lead / Admin

Answers questions like "show me all jobs for site X last month" or "which engineer is most productive."

- **Job data** — every job, filterable by date, site, project, state, or engineer.
- **Hardware** — material issues, with a Pending-only view to see what's still outstanding.
- **Engineer productivity** — jobs completed and completion rate per field engineer.
- **Productivity** — jobs handled and hours logged in, per employee.

1. Set your filters (date range, project, etc.) at the top.

2. Press **Export full report (Excel)** for one file with everything, or **Export to CSV** on a single tab for just that data.

8. Logs Team Lead / Admin

A simple activity history — who did what, and when. Every site added, every status change, every login and logout is recorded here automatically. You never need to add anything here yourself.

9. Users Admin only

This is where new employees get access to the platform.

1. Go to **Users**, press **Add employee**.

2. Enter their office email, full name, and role (Support, Team Lead, or Admin).

3. Press **Create employee**. They can log in immediately using the email + code method from Section 1. There is no password to set.

Someone left the company? Press **Deactivate** next to their name. Their old work stays in the records, but they can no longer log in.

10. Common questions

I didn't get my login code.

Check your Spam/Junk folder. Wait 60 seconds, then press Resend code. Make sure you typed your exact office email.

Why can't I mark my job as Completed?

Check that Handover Status is set to Done, and that there are no unresolved material issues on that job. The system will tell you exactly which one is blocking you.

I was logged out while I was still working.

If your screen was idle for more than 15 minutes, the system signs you out automatically for security. Just log in again — your earlier work is already saved.

Can two people edit the same job at the same time?

Yes, but the second save will overwrite the first, so it's best to coordinate if you know a colleague is on the same job.

I don't see Reports, Logs, or Users in my menu.

These are only visible to Team Lead and Admin roles. If you believe you should have access, ask your Admin to check your role under Users.

Who do I contact if something looks wrong?

Contact your Team Lead or Admin. They can check the Logs section to see exactly what happened and when.
